Professional Summary

Data Analyst (B.Tech, in progress) with hands-on project experience in Python, Pandas, Tableau, and Scikit-learn. Built end-to-end analytics pipelines across real estate, e-commerce, and retail domains — from raw data cleaning to interactive business dashboards. Focused on translating large-scale datasets into actionable, revenue-impacting insights.

Education

Bachelor of Technology (B.Tech) — Computer Science & Artificial Intelligence
Newton School of Technology, Rishihood University

Expected: 2028
CGPA: 8.9 / 10

Technical Skills

Languages	Python, SQL
Analysis	Pandas, NumPy, Scikit-learn (KMeans), Statistical Hypothesis Testing (Welch's t-test, IQR, Shapiro-Wilk), EDA
Visualization	Tableau, Looker Studio, Matplotlib, Seaborn
Tools	Jupyter Notebook, Google Sheets, Git, GitHub
Concepts	Data Cleaning & ETL, Feature Engineering, Dashboarding, Price Elasticity, Clustering, Regression Analysis

Projects

US House Price Analysis Across 10 States	Group Project — Newton School of Technology DVA Capstone
Tools: Python, Pandas, Tableau, Jupyter Notebook, Statistical Analysis [GitHub ↗]	
- Performed full EDA (univariate, bivariate, multivariate) on 11,410 residential listings across 10 US states; showed California's \$1.16M average inflates the national mean by 45% when included. - Built a 5-notebook Python ETL pipeline (extraction → cleaning → EDA → statistical analysis → load), engineering features <code>price_per_sqft</code>, <code>weekday</code>, and <code>is_weekend</code> for downstream analysis. - Conducted Welch's t-test on weekday vs. weekend listings, confirming a statistically significant \$150K price gap driven by broker composition, not pricing strategy. - Ran scenario analysis (California excluded), revealing a 45% drop in national average (\$975K → \$534K), directly supporting the recommendation to segment California in all national reporting. - Identified North Carolina as the highest price/sqft efficiency market (\$684/sqft), projecting 15–20% higher yield on a \$10M portfolio vs. California. - Delivered 3 interactive Tableau dashboards (Geographic Overview, Broker Analysis, Market Trends) with state and weekday filters for investor and brokerage use cases.	
Blinkit Pricing Intelligence Dashboard	Individual Project
Tools: Python, Pandas, Scikit-learn, Matplotlib, Seaborn, Looker Studio, Google Sheets [GitHub ↗]	
- Analysed 5,000 orders across 268 products in 11 categories; flagged 26 at-risk products where discount rates above 30% were eroding profit margins. - Estimated price elasticity across product categories, finding inelastic demand — supporting margin optimisation with minimal sales volume risk. - Applied KMeans clustering to segment 268 products into 3 pricing tiers (Budget / Mid-Range / Premium); Premium generates 3.3× revenue per item vs. Budget. - Simulated revenue uplift by category: Fruits & Vegetables identified as highest-opportunity segment (+17.6% potential uplift) via MRP vs. selling price gap analysis. - Identified 15 opportunity products with untapped pricing headroom; built Looker Studio dashboard covering KPIs, monthly revenue trends, and pricing opportunity distribution. - Detected seasonal patterns (August peak, December dip) enabling proactive pricing strategy for procurement and marketing teams.	
Retail Store Sales Performance Analysis	Group Project
Tools: Python, Pandas, Tableau / Looker Studio [GitHub ↗]	

- Cleaned and transformed **12,575 transactional records**: handled missing items, imputed zero-value discounts, derived missing price/quantity fields, and engineered **Month** and **Day_of_Week** columns for trend analysis.
- Built **revenue concentration analysis** identifying top-performing categories and finding applied discounts do not significantly increase transaction frequency.
- Developed **interactive sales dashboard** tracking KPIs across revenue, discount impact, day-of-week patterns, and store location performance for operational decision-making.
